

A targeted choice of  
BI tools

BI FitnessScout

Business Intelligence is not an isolated technology, but the concept behind a performance-oriented team game.

This concept includes strategic management ideas, appropriate, cost-effective software tools, technical infrastructure and processes that meet the requirements and of course well-trained users as well. And the better the tools are coordinated as an ensemble in this complicated structure, the fitter the enterprise will be as a top team in business. There are many business intelligence software tools on the market, but only a few will suit your specific requirements: In some cases for example, the cost of implementation is not economically viable, whilst other BI solutions lack the required functionality or they cannot integrate fully into a company's infrastructure and processes. There are many different options, and there is a danger of scoring an own goal in choosing the wrong tool.

Wrong tool decisions often only become apparent during the BI project execution, but then it is usually too late. Actinium's BI FitnessScout eliminates these risks. It is a tried and tested evaluation method to proof of concept which systematically determines the BI software that best suits your operational fitness requirements. From the functional, technical and economical points of view. Taking all success factors into account, and ensuring that your company leaves a lasting impression on your competitors.

**Four reasons to choose BI FitnessScout**

- Systematic comparative analysis of relevant BI tools
- Particular emphasis on simplicity in implementation and use
- Extensive competence and experience
- Flat-rate implementation fee
